

Java-排序-小组中每位都有一张卡片

题目描述：

小组中每位都有一张卡片，卡片上是 6 位内的正整数，将卡片连起来可以组成多种数字，计算组成的最大数字。

输入描述：

“,”号分割的多个正整数字符串，不需要考虑非数字异常情况，小组最多 25 个人

输出描述：

最大的数字字符串

补充说明：

示例 1

输入：

22,221

输出：

22221

说明：

示例 2

输入：

4589,101,41425,9999

输出：

9999458941425101

说明：

```
import java.util.*;
```

```
import java.util.stream.Collectors;
```

```
// 注意类名必须为 Main, 不要有任何 package xxx 信息
```

```
public class Main {
```

```
    private static String max = "";
```

```
    public static void main(String[] args) {
```

```
        Scanner scanner = new Scanner(System.in);
```

```
        while (scanner.hasNextLine()) {
```

```
            String[] split = scanner.nextLine().split(",");
```

```
            List<String> collect = Arrays.stream(split).sorted().collect(Collectors.toList());
```

```
            List<Num> comStrList = new ArrayList<>();
```

```
            int max = collect.stream().map(String::length).max(Integer::compareTo).get();
```

```
            for (int i = 0; i < collect.size(); i++) {
```

```
                String s = collect.get(i);
```

```
                String compareStr = s;
```

```
                if (compareStr.length() < max) {
```

```
                    compareStr += "0";
```

```
                }
```

```
                comStrList.add(new Num(s, compareStr));
```

```

    }

    List<Num> collect1 = comStrList.stream().sorted((s1,s2)->{
        String string = s1.string;
        String string1 = s2.string;
        if (string1.length() > string.length() && string1.startsWith(string)) {
            string1 = string1.substring(string.length());
        } else if (string.length() > string1.length() && string.startsWith(string1)) {
            string = string.substring(string1.length());
        }
        return string.compareTo(string1);
    }).collect(Collectors.toList());
    for (int i = collect1.size()-1; i >=0; i--) {
        System.out.print(collect1.get(i).string);

    }
    System.out.println();
}
