```
一、编程题
```

ACM: 二叉树的广度优先遍历

题目描述:

有一棵二叉树,每个节点由一个大写字母标识(最多 26 个节点)。现有两组字母,分别表

示后序遍历(左孩子->右孩子->父节点)和中序遍历(左孩子->父节点->右孩子)的结果,

请输出层次遍历的结果。

输入描述:

输入为两个字符串,分别是二叉树的后续遍历和中序遍历结果。

输出描述:

输出二叉树的层次遍历结果。

补充说明:

```
示例1
輸入:CBEFDA CBAEDF
輸出:ABDCEF
说明:二叉树为:
A
/\
B D
/ /\
C E F
```

```
代码:
class Node:
     def __init__(self, id, left= None, right = None):
           self.id = id
           self.left = left
           self.right = right
tree1, tree2 = input().split()
def getSup(t1, t2):
     if len(t1)==1:
           return Node(t1[0])
     if len(t1) == 0:
           return None
     sup = t1[-1]
     ind = t2.find(sup)
     leftt2 = t2[:ind]
     rightt2 = t2[ind+1:]
     leftt1 = [i for i in t1 if i in leftt2]
```

```
rightt1 = [i for i in t1 if i in rightt2]
     left = getSup(leftt1, leftt2)
     right = getSup(rightt1, rightt2)
     supnode = Node(sup, left, right)
     return supnode
whole = getSup(tree1, tree2)
ans = ''
temp = [whole]
while temp != []:
     next_level = []
    for n in temp:
          ans += n.id
          if n.left!= None:
               next_level.append(n.left)
          if n.right != None:
               next_level.append(n.right)
     temp = next_level
print(ans)
```
